## **New Study from Ceresana Research: Bioplastics are Flourishing**

Shopping bags, fast-food utensils, and garbage sacks that decompose into compost after use: bioplastics are not only environmentally-friendly, but they can also be economically advantageous. “Despite the financial crisis, manufacturers of biodegradable plastics were able to demonstrate moderate growth in this past year,” explains Oliver Kutsch, president of Ceresana Research.

### **Potential or Over-enthusiasm?**

A new study from Ceresana Research analyzes the market for biodegradable polymers. Expectations for bioplastics are high: a better image for plastics, independence from petroleum products, solutions for waste problems, contributions to environmental protection, as well as a new source of income for the agricultural sector. However, the characteristics and potentials of different bioplastics vary substantially – accordingly, there is a high demand for related information.

### **Increasing Competition for Petrochemicals**

Plastics made from renewable materials and biodegradable polymers are rapidly catching up. Bioplastics are already unbeatable in certain, special applications – for example, medical implants, which dissolve in the body, or compostable mulch films for agriculture. As a result of remarkable advances in development, bioplastics are also increasingly capable of replacing common, standard polymers. In this regard,

packaging materials constitute the most important application area; for example, filler materials that are utilized in very large amounts. However, the largest growth rates are seen in the automotive and electronics industries: Bioplastics can be applied to articles like consoles or cellular phone cases. During the past eight years alone, consumption of biodegradable plastics based on starch, sugar, and cellulose (so far the most important raw materials) has increased by 600%. Starch-based plastics currently dominate in Europe, and polylactic acid is considered to be particularly promising.

### **Concise Overview**

With over 400 pages, Market Study – Bioplastics presents the most important information on different bioplastic types, including their advantages and application possibilities, legal situations and certifications, as well as disposal and recycling. This useful compilation provides 77 profiles of current and future manufacturers, with information on individual product portfolios, as well as existing and planned capacities. The study examines, in detail, the situation of bioplastics throughout the European, North American, and Asian-Pacific regions, particularly in the seven countries with the highest revenues. Ceresana Research will gladly send you additional information and a complimentary sample reading from this market report: [www.ceresana.com/en](http://www.ceresana.com/en)

### **About Ceresana Research**

Ceresana Research is an international market research institution specializing in raw materials and chemicals, as well as plastics and additives. Our research, analysis, and guidance regarding global markets, can be used by manufacturers and processors as a steadfast basis for decision-making. Successful companies and organizations throughout more than 40 countries are already profiting from our studies: systematic presentation of data and facts adds transparency to current trends, opportunities, and risks. You can also acquire this crucial insight and strategic, competitive advantage!
